

TEXTQUERY

Text 'Regency Apartment' to 8123* for instant textback info. Add your email address for full PDF file attachment.

TextQube is a software application easily loaded onto your computer allowing you to automatically respond to remote text messages from mobile phones, for example to send instant information back to the mobile (or email address sent by the mobile) or remotely control a device from the mobile.

TextQube listens constantly for new messages.

How can you use it?

- Run marketing campaigns with inbound SMS as a reply option
- Receive sales enquiries by text message
- Enable field-based engineers to update you with problem progress
- Place your dedicated SMS phone number on "For Sale" boards
- Offer patients the ability to confirm appointment reminders
- Remotely control devices in your home

Example scenario for Estate Agents

TextQube has an internal database to represent each item of interest. Each item has a unique reference number. In the case of estate agents, the software can be configured to pickup all the property data in their existing application or the details can be added separately for each property. For each item of interest, a pdf document can be automatically created including pictures.

A small waterproof label is printed by *TextQube* containing the appropriate message. This is stuck onto the FOR SALE sign for the property. Any person sending the appropriate message will receive an instant SMS message about the property and/or receive an email containing the pdf document with full detail of the property as a file attachment to an email.
